COVID-19 Monoclonal Antibody Eligibility: Treatment and Post-Exposure Prophylaxis

Purpose: Monoclonal antibodies are used to neutralize the COVID-19 virus and intended to prevent progression of disease. The U.S. Government is currently supplying REGEN-COV (casirivimab and imdevimab) for the treatment and post-exposure prophylaxis of COVID-19. The dosing is the same for both indications (casirivimab 600mg and imdevimab 600mg).

WHO IS ELIGIBLE

Adult or pediatric (<u>>12</u> years of age and weighing at least 40 kg) patient at **high risk** for progressing to severe disease or death.

High Risk Factors for Treatment and Post-exposure Prophylaxis (patient should have one or more high risk factors as listed below or determined by the evaluating healthcare provider):

- \Box Older age (for example <u>>65</u> years of age)
- □ Obesity or being overweight (for example, adults with BMI \geq 25, or if age 12-17, have BMI \geq 85th percentile for their age and gender based on <u>CDC growth charts</u>)
- Pregnancy
- Chronic Kidney Disease
- Diabetes
- □ Immunosuppressive disease or immunosuppressive treatment
- □ Cardiovascular disease (including congenital heart disease) or hypertension
- Chronic lung diseases (for example, chronic obstructive pulmonary disease, asthma [moderate-to-severe], interstitial lung disease, cystic fibrosis, and pulmonary hypertension)
- Sickle cell disease
- Neurodevelopmental disorders (for example, cerebral palsy) or other conditions that confer medical complexity (for example, genetic or metabolic syndromes and severe congenital abnormalities)
- Having a medical-related technological dependence (for example, tracheostomy, gastrostomy, or positive pressure ventilation (not related to COVID-19)
- Other medical conditions or factors (for example, race or ethnicity) may also place individual patients at high risk for progression to severe COVID-19 and authorization of mAb therapy is not limited to the medical conditions or factors listed above. For additional information on medical conditions and factors associated with increased risk for progression to severe COVID-19, visit the CDC website.

FOR COVID-19 POSITIVE PATIENTS

Treatment Dosing: Patients who are COVID positive, with mild to moderate symptoms, not hospitalized due

to COVID symptoms, and not requiring oxygen or an increase in home oxygen therapy are eligible.

COVID+ test da	ate Date of sympt	com onset	(must be <10 days)
Symptoms	 Fever or chills Muscle or body aches New loss of taste or smell Nausea or vomiting 	□ Cough □ Sore throat □ Congestion or ru □ Diarrhea □	 Shortness of breath or difficulty breathing Headache unny nose Other:

COVID-19 Monoclonal Antibody Eligibility: Treatment and Post-Exposure Prophylaxis

Post-Exposure Prophylaxis

Post-Exposure Prophylaxis (PEP): Individuals who are <u>not fully vaccinated</u> **or** who are not expected to mount an adequate immune response to <u>complete SARS- CoV-2 vaccination</u> (for example, individuals with immunocompromising conditions including those taking immunosuppressive medications) **AND**

- have been exposed to an individual infected with SARS-CoV-2 consistent with <u>close contact criteria per</u> <u>CDC</u> OR
- who are at high risk of exposure to an individual infected with SARS-CoV-2 because of occurrence of COVID-19 in other individuals in the same institutional setting (for example, nursing homes, prisons)

Vaccination Status (must answer yes to one criteria for eligibility)	Yes	No
Patient <u>not</u> fully vaccinated (<2 weeks from 2 nd dose of 2 nd dose series		
or <2 weeks from single dose injection)		
Patient <u>not</u> expected to mount an adequate immune response to		
complete SARS-CoV-2 vaccination (i.e. immunocompromised or taking		
immunosuppressive medications)		
Exposure (must answer yes to one criteria for eligibility)	Yes	No
Patient has been in close contact (<6 feet distance for >15 minutes) to		
an infected individual		
Patient high risk of exposure because of infection in the same		
institutional setting (i.e. nursing homes, prisons)		

I have confirmed that the patient is interested in receiving the monoclonal antibody treatment
